## **Sewer Treatment Plant Update**

The new Phase II wastewater treatment plant project is complete and has been in operation for several months with great treatment results. A contractor is on site constructing a new concrete entrance road to the plant that will improve access to the plant and improve drainage in the area around the plant as well as prevent flood runoff across the property to adjacent areas in the community.

The new plant is already over 50% utilized at its new capacity. Phase III of the wastewater treatment plant will further increase the capacity of the plant from 600,000 gallons per day to 945,000 gallons per day to keep pace with future growth. Phase III has been designed and will be bidding this month and is expected to begin construction early next year.

Beautification and gating of the entrance area will be considered as future improvements.
